The focus of our customers

Legacy system modernisation

Transform, modernise, migrate and upgrade outdated legacy systems to up-to-date and secure systems which drive cost efficiency and performance optimisation.

System integration

Integrate systems from multiple departments or business units with high degrees of complexity. This provides more consolidated services to the customer, improves internal operations, and reduces operational costs.

Data-driven insights

With large amounts of data that need to be consolidated and analysed, back-end and server administration activities are critical to pulling real-time and accessible information.

Bespoke development and customisation

Analyse, advise and build bespoke software development and customisation to core systems that meet varied requirements. These developments will then help to achieve optimal efficiency in a wide range of activities, especially in mortgage management.

And also:

- KYC process and face recognition
- Mortgage process management
- Financial products and services distribution solutions
- Consumer finance solutions
- Application conversion and migration

What we learned

01 ***Data protection***
is a key focus not only in the system but during the transformation process
02 ***Being agile***
is a challenge but is a success factor

03 ***Knowledge transfer***
is another success factor

04 ***Transformation***
is also about integrating people

Thank you
